

- Image Processing and Computer Vision
 - A computer vision system uses the image processing algorithms to try and perform emulation of vision at human scale.
 - Image Processing is the field of enhancing the images by tuning many parameter and features of the images.
 - Image Processing is the subset of Computer Vision.

Evolution's Big Bang: Cambrian Explosion, 530-540million years, B.C.

Camera Obscura

- Camera Obscura in San Francisco

What is an image?

- Image: a visual representation in form of a function $f(x, y)$
 - where f is related to the brightness (or color) at point (x, y)
 - Most images are defined over a rectangle
 - Continuous in amplitude and space

[Albrecht Dürer, 1525]

- Digital image: discrete samples $f[x,y]$ representing continuous image $f(x,y)$
- Each element of the 2-d array $f[x,y]$ is called a pixel or pel (from “picture element”)

200x200

100x100

50x50

25x25

Why do we process images?

- Acquire an image
 - Correct aperture and color balance
 - Reconstruct image from projections
- Prepare for display or printing
 - Adjust image size
 - Color mapping, gamma-correction, halftoning
- Facilitate picture storage and transmission.
 - Efficiently store an image in a digital camera
 - Send an image from space
- Enhance and restore images
 - Touch up personal photos
 - Color enhancement for security screening
- Extract information from images
 - Read 2-d bar codes
 - Character recognition
 - Depth estimation
- Many more ... image processing is ubiquitous

Image Processing Examples

The Smile Shutter flow

Imagine a camera smart enough to catch every smile! In Smile Shutter Mode, your Cyber-shot® camera can automatically trip the shutter at just the right instant to catch the perfect expression.
